 AB One of the poly(aminoquinoxaline) compds. series, poly(2,3-dithienyl-5-
 aminoquinoxaline), P(AQX-06) has high potential as an electrochem. capacitor
 electrode materials. In the Et4N⁺ tetrafluoroborate (TEABF4) MeCN media,
 P(AQX-06)/C felt electrode showed electrochem. redox activity at potential
 window between -1.8 and 1.5 V vs. Ag wire. First, specific capacity of P(AQX-
 06) was lower level, but it gradually rose to reach at 134 Ah kg⁻¹ (210 Fg⁻¹)
 after 3600 cycling. Such high capacity was maintained after further 2000
 cycling. The charge use of P(AQX-06)/C felt electrode showed 62%, which is
 higher level than other conductive polymer materials. By SEM anal., a lot of
 pores are observed on the surface of the electrode after the cycling.

I

II

AB Disclosed is a composition for energy storage device electrodes which contains a carbon material and a polyaminoquinoxaline compound I or II (R1 and R2 independently represent a hydrogen atom, a hydroxyl group, a C1-10 alkyl group, a C1-10 alkoxy group or the like; R3 and R4 independently represent a hydrogen atom, a halogen atom, a cyano group, a nitro group, an amino group, a C1-10 alkyl group, a C1-10 alkoxy group or the like; X1 represents -NH-R5-NH- or -NH-R6-, wherein R5 and R6 independently represent a C1-10 alkylene group, -C(O)CH2-, -CH2C(O)- or the like; and n represents an integer of ≤2.). By using such a composition for energy storage device electrodes, there can be obtained an electrode which enables to increase the d. of energy level of the device.

AB The electrode uses a polyaminoquinoxaline I [R1-4 are substituents selected from H, OH, halogen, -CN, -NO₂, amino, and organic groups; X1 = -NHR5NH or -NHR6- with R5 and R6 being bivalent organic groups] as active mass. The electrode is prepared by applying the polyaminoquinoxaline on a collector, or by electrolytic polymerization of II (X2 = -NHR7NH2 or -NHR8, R7 = bivalent organic group, R8 = cyclic or condensed heteroaryl group) on a collector.

AB The invention relates to preparation of aminoquinoxaline compds. represented by the formula I, where R1 and R2 each independently represents hydrogen, hydroxy, C1-10 alkyl, C1-10 alkoxy, etc.; R3 and R4 each independently represents hydrogen, halogeno, cyano, nitro, amino, C1-10 alkyl, C1-10 alkoxy, etc.; and X1 represents -NH-R5-NH2 or -NH-R6. The compds. have excellent heat resistance and the electrochem. oxidation/reduction potential of which can be easily controlled, and the compds. have extremely narrow band gaps and high fluorescent properties. The preparation of polyaminoquinoxaline compds. obtained by polymerizing the compound I is also provided.

AB An aniline derivative and a metal complex thereof which are excellent in conductivity, processability, elec. stability, thermal stability, mech. stability, etc. and are advantageously usable as, e.g., conductive mols. in various fields. The aniline derivative is one represented by the following R-C6H4-NH-(repeating unit)n-C6H4-R, wherein, the benzene ring substituted with 4 of R' (R, R' = H, alkyl, alkoxy, aryl, etc.; repeating unit = aniline derivative repeating unit substituted with heterocyclicl which has 2 Ns and closes heterocyclic ring with neighboring carbon of backbone chain via single or double bond; and n = integer 1-500).

 AB Monomeric and polymeric 5-nitroquinoxaline derivs. disubstituted in the 2 and
 3 positions with 2-pyrrolyl (A), 2-furyl (B) and 2-thienyl (C) groups were
 prepared and characterized. The substituted 5-nitroquinoxalines were used as
 active components in poly(vinyl chloride)-membrane and electropolymerd.
 electrodes that were then tested as possible sensors for various cationic
 species. In contrast to the difurylnitroquinoxaline-based systems, the
 monomeric and polymeric dipyrrolyl- and dithienylquinoxaline electrodes
 displayed a good selectivity for Ag⁺ ions, providing a near-Nernstian response
 in the 10⁻⁵ to 10⁻² mol L⁻¹ concentration range. The similar potentiometric
 behavior displayed by the monomeric and polymeric forms of systems A and C
 supports the contention that the main binding modes displayed by the monomeric
 forms are retained in the corresponding polymeric structures.

AB The title film, useful for a color filter, electrophotog. device, photosensor,
solar cell, electroluminescence device, optical recording device, optical
nonlinear device, optoelectronic device, photochromic film, electrochromic
film, gas sensor and ion sensor, is prepared by an electrochem. reduction of a
surfactant containing an aromatic azo residue, dispersed in a water or water
containing solvent. The title method requires min. or zero use of binder
resin.

AB In acidic aqueous solns., a glassy C electrode coated with an anodically-formed polymer of 1-aminophenazine (1-AP) mediates the reduction of dissolved 1-AP, Ce(IV), Fe(III) and O. The effective surface area of the electrode appears to be reduced by several percent by the coating. Oxidation of V(II) is also mediated at the 1-AP-coated electrode but that of Fe(II) is blocked in accord with thermodyn. predictions. In neutral solution, reaction of the Fe(CN)63-/2- couple is not mediated at the coated electrode. The rate-determining step for mediated 1-AP, Fe(III) and Ce(IV) reduction at a coated rotating disk electrode is diffused in the bulk solution, but reaction at or in the coating influences the rate of V(II) oxidation and O2 reduction. The reduction of O degrades the coating.

PRIORITY APPLN. INFO.: FR 1979-4447 19790221
 AB Organic compds. which contain Si, halogen, N, S, P, B, and/or O atoms and contain NH2, OH, SH, NCO, NSO, and/or NCS groups as well as cyano and/or ethynyl groups are mixed with a filler, such as TiO2, MoS2, Al, W, Co, Cu, graphite, glass fibers, asbestos, quartz, or silica, and polymerized to prepare \approx 110 heat-resistant resins which are especially useful as binders (e.g., for abrasive particles such as diamonds and Si carbide) and adhesives. In some cases, the resins also contain a polyimide, polybenzoxazole, polyoxadiazole, polythioarylene, or similar resin which improves their mech. properties and heat resistance. Thus, 0.4 g powdered polybenzoxazole prepared from bis(4-amino-3-hydroxyphenyl)methane and isophthalic acid was mixed with asbestos 0.8, 2,5-diamino-3,4-dicyanothiophene 0.24, and bis(4-isocyanatophenyl)methane 0.36 g and cured in a mold for 90, 90, and 30 min at 190, 250, and 300°, resp. The compressive strength (kg/cm²) of the molding was 1000 initially and 1150 after 500 h at 300° in air.

AB Monomers (and, in some cases, low-mol.-weight polymers) containing NH₂, OH, SH, NCO, NSO, and/or NCS groups as well as cyano and/or ethynyl groups are polymerized to prepare .apprx.110 polymers which are resistant to degradation at 300-400°. In most cases, the monomers and low-mol.-weight polymers are mixed with fillers such as TiO₂, powdered metals, glass fibers, carbon fibers, graphite, powdered polyoxadiazole, polybenzoxazole, polyimide, or fluoropolymer, asbestos, MoS₂, BN, silica, diamond dust, and/or SiC. The heat-resistant polymeric materials are useful as moldings, adhesives, grinding disks, etc. Thus, a mixture of bis(3-amino-4-cyanophenyl) ether 0.16, bis(4-isocyanatophenyl)methane 0.16, graphite 0.2, and a powdered poly-1,3,4-oxadiazole 0.78 g was molded at 130-200°/245 bars, demolded, and heated at 300° for 30 min to prepare a molding which had compressive strength (MN/m²) 96 initially and 108 after 500 h in air at 300° and had flexural strength (MN/m²) 31 initially and 35 after heat aging.
